Real-World Comparative Effectiveness of Long-Acting Injectable and Oral Antipsychotics Among US Medicare Beneficiaries With Schizophrenia

Pengxiang Li,[1] Zhi Geng,[1] Carmela Benson,[2] Charmi Patel,[2] Jalpa A. Doshi[1]

[1]University of Pennsylvania, Philadelphia, PA, USA; [2]Janssen Scientific Affairs, LLC, a Johnson & Johnson company, Titusville, NJ, USA

Introduction

- Schizophrenia is a chronic mental illness characterized by delusions, hallucinations, and other disabling psychiatric symptoms
- Continuous treatment with antipsychotic medications is crucial in the management of schizophrenia to reduce the risk of acute psychotic episodes and prevent relapse and psychiatric hospitalization[1]
- Oral antipsychotics (OAPs) have been the mainstay of schizophrenia treatment, though their effectiveness has been hindered by poor adherence[1]
- Long-acting injectable antipsychotics (LAIs) that require less frequent administration (e.g., every 1 month, every 3 months) were developed to improve medication adherence relative to daily OAPs[2]
- Little real-world evidence exists comparing the benefits of LAIs relative to daily OAPs in the Medicare population, which includes about half of US patients with schizophrenia[3]

Objective

- To compare effectiveness of LAIs and daily OAPs across different agents and dosing intervals in a national sample of Medicare beneficiaries with schizophrenia

Methods

Data source

- Data were taken from the 2006-2019 national Chronic Conditions Warehouse 100% Medicare Part A, B, and D claims and beneficiary summary files available from the Centers for Medicare and Medicaid Services

Study sample

- The sample included all fee-for-service Medicare beneficiaries with schizophrenia and ≥1 antipsychotic fill between 01/01/2006 and 12/31/2019
  - Index date = first antipsychotic prescription date
- Patients were required to meet the following criteria:
  - Age ≥18 years on index date
  - Continuous fee-for-service Medicare Parts A, B, and D coverage 6 months before and after the index date

Follow-up period and treatment sub-periods

- The follow-up period for each patient was from the index date until death, transition to Medicare Advantage Prescription Drug (MAPD) plan, or December 31, 2019, whichever occurred earlier
- Each patient's follow-up period was divided into treatment periods, with a new treatment period starting on the date of change in the treatment exposure
  - The treatment periods continued until there was evidence of a ≥60-day continuous gap of the specific treatment exposure
  - Periods with a 60-day or longer continuous gap in any antipsychotic use were categorized as no antipsychotic use treatment periods
  - The treatment periods were then further divided into sub-periods, with a new sub-period starting on the day after the date of occurrence of an outcome event (see Outcomes section below)

Outcomes

- Treatment failure, the primary study outcome, was a composite measure of psychiatric hospitalization, antipsychotic discontinuation, suicide attempts, or death
  - Antipsychotic discontinuation was defined as a continuous gap of ≥60 days after the days' supply of the most recent antipsychotic prescription was exhausted
  - Psychiatric hospitalization was defined as the presence of a medical claim for an inpatient admission with a diagnosis code of a psychiatric disorder in the first or second position
  - Relapse was defined as the occurrence of an inpatient admission or Emergency Room visit with a diagnosis of schizophrenia in the first or second position

Analysis

- The primary analytic approach was within-individual Cox regressions, in which each individual served as his or her own control to remove selection bias
- In the first set of analyses, we compared outcomes across all LAIs (aripiprazole, fluphenazine, haloperidol, olanzapine, paliperidone, and risperidone) and OAPs (first-generation antipsychotics [FGA]: fluphenazine, haloperidol, and other FGA; second-generation anti-psychotics [SGA]: aripiprazole, clozapine, lurasidone, olanzapine, paliperidone, quetiapine, risperidone, and ziprasidone, and other SGA)
- In the second set of analyses (i.e., main analyses), we further separated the LAI agents with sufficient sample size by dosing interval: paliperidone (every month and every 3 months), aripiprazole (every month and every 1.5-2 months), and fluphenazine (every month and every 1.5 months)
- LAI haloperidol was used as the reference group in both sets of analyses
- All outcomes (except death) were recurrent and were treated as such in the regression models
  - Follow-up time was reset to zero after each outcome event to allow comparison of treatment sub-periods within each individual
  - The unit of analysis was the sub-period
- Given the within-individual analyses, control variables for time-invariant covariates were not required; however, we controlled for the following time-varying covariates: years from the first ever schizophrenia diagnosis date in Medicare claims until the starting date of each sub-period, number of relapses within 3 months before the starting date of a sub-period, and order of exposure (number of treatments used before this sub-period)

Results

- The final sample included 152,835 beneficiaries (mean age 53.5 years [SD: 16.7], 54.0% male, 61.5% White, **Table 1**)

TABLE 1. Baseline characteristics

Characteristics	N	%
Number of patients	152,835	100%
Age, mean (SD)	53.5 (16.7)	
≤24 years	3,557	2.3%
25 to 34 years	18,814	12.3%
35 to 44 years	25,268	16.5%
45 to 54 years	35,706	23.4%
55 to 64 years	27,096	17.7%
≥65 years	42,394	27.7%
Sex		
Female	70,271	46.0%
Male	82,564	54.0%
Race		
White	94,050	61.5%
Black	45,936	30.1%
Hispanic	6,486	4.2%
Other	6,363	4.2%
Part D low-income subsidy status		
Full LIS	130,604	85.5%
Partial LIS	1,884	1.2%
Non-LIS	20,347	13.3%
Original reason for Medicare eligibility		
Age	26,153	17.1%
Disability	126,210	82.6%
ESRD	1210	0.8%
Census region		
Midwest	35,609	23.3%
Northeast	27,656	18.1%
South	61,672	40.4%
West	27,455	18.0%
Metropolitan status		
Urban	127,216	83.2%
Rural	25,619	16.8%
Number of Elixhauser comorbidities		
0	7,348	4.8%
1 to 2	45,478	29.8%
3 to 4	39,509	25.9%
5+	60,500	39.6%

ESRD, end-stage renal disease; LIS, low-income subsidy; SD, standard deviation.

Treatment failure

- In the first set of agent-level analyses, oral clozapine (HR 0.79; 95% CI 0.76-0.82) was the only OAP associated with significantly lower hazard of treatment failure than LAI haloperidol (**data not shown**)
  - With the exception of LAI fluphenazine (HR 1.09; 95% CI 1.04-1.13) and LAI olanzapine (HR 1.56; 95% CI 1.41-1.73), all LAIs were associated with lower hazard of treatment failure (HRs 0.78-0.88) than LAI haloperidol
- In the second set of analyses further breaking out LAIs by dosing intervals, all OAPs were associated with a significantly higher hazard (HRs 1.03-1.56) of treatment failure than LAI haloperidol, with the exception of clozapine, olanzapine, paliperidone, and fluphenazine (HR 0.88; 95% CI 0.83-0.93), risperidone (HR 0.81; 95% CI 0.79-0.84), and paliperidone every month (HR 0.78; 95% CI 0.75-0.80) (**Figure 1**)
  - LAI paliperidone every 3 months (HR 0.55; 95% CI 0.49-0.62) had the lowest hazard of failure compared with LAI haloperidol

Antipsychotic discontinuation

- Compared with LAI haloperidol, nearly all OAPs were associated with lower hazard of antipsychotic discontinuation (HRs 0.67-0.94), the only exceptions being oral haloperidol (HR 0.96; 95% CI 0.92-1.01), oral lurasidone (HR 0.96; 95% CI 0.90-1.04), and other oral SGA (HR 1.05; 95% CI 0.96-1.14) (**Figure 2**)
- LAI fluphenazine every month (HR 1.58; 95% CI 1.47-1.71) was the only LAI associated with a significantly higher odds of antipsychotic discontinuation than LAI haloperidol
  - LAI paliperidone every 3 months (HR 0.17; 95% CI 0.13-0.21) had the lowest hazard of antipsychotic discontinuation compared with LAI haloperidol

Psychiatric hospitalization

- Compared with LAI haloperidol, all OAPs except oral clozapine (HR 0.92; 95% CI 0.88-0.96) were associated with a significantly higher hazard of psychiatric hospitalization (**Figure 3**)
- Compared with LAI haloperidol, LAI olanzapine (HR 2.13; 95% CI 1.91-2.37) and LAI aripiprazole every month (HR 1.08; 95% CI 1.01-1.16) were associated with a significantly higher risk of psychiatric hospitalization
- LAI paliperidone every month (HR 0.93; 95% CI 0.89-0.97) was the only LAI associated with a significantly lower hazard of psychiatric hospitalization relative to LAI haloperidol
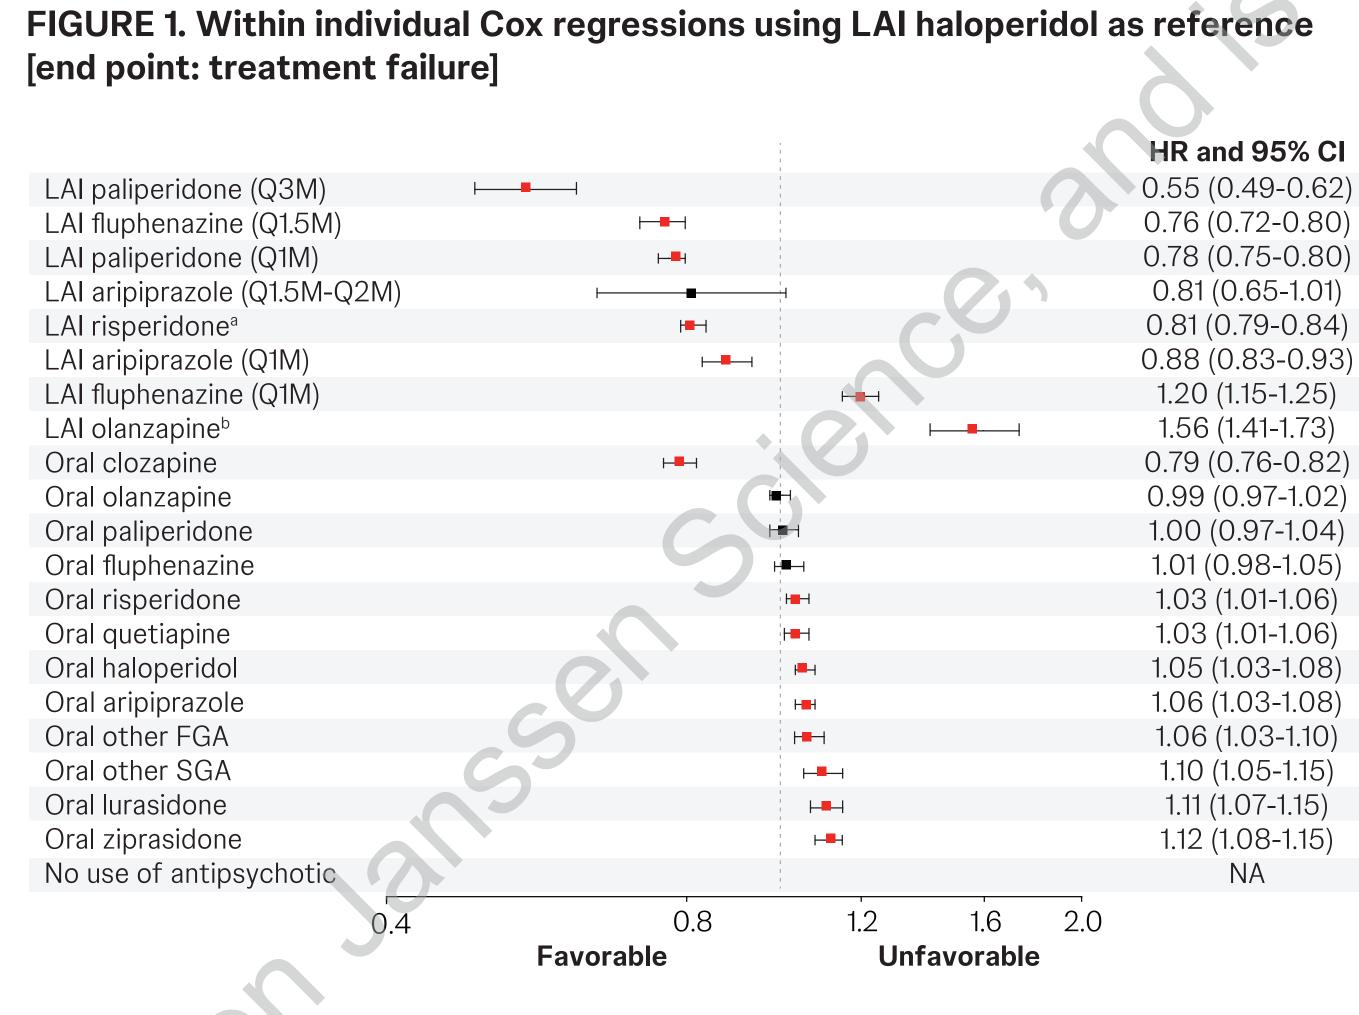

Relapse

- Compared with LAI haloperidol, all OAPs except oral clozapine (HR 0.96; 95% CI 0.93-0.99) were associated with a significantly higher hazard of relapse (**Figure 4**)
- LAI paliperidone every month (HR 0.94; 95% CI 0.91-0.97) and LAI paliperidone every 3 months (HR 0.84; 95% CI 0.76-0.94) were the only LAIs with a significantly lower hazard of relapse than LAI haloperidol

FIGURE 1. Within individual Cox regressions using LAI haloperidol as reference [end point: treatment failure]

Red squares highlight statistically significant HRs, while black squares are HRs that did not reach statistical significance.

Limitations

- Our study is only generalizable to the fee-for-service Medicare population with standalone Part D coverage and not other insurance types (Medicaid, commercial, etc.)
- Our within-individual Cox regressions controlled for observed and unobserved time-invariant confounders as well as observed time-varying confounders, but we cannot rule out the possibility of unobserved time-varying confounders that could bias our results

Conclusions

- This real-world comparative effectiveness study found that most OAPs were associated with a significantly higher risk of treatment failure, psychiatric hospitalization, and relapse than LAI haloperidol
  - Additionally, virtually all OAPs had a lower risk of antipsychotic discontinuation relative to LAI haloperidol
- Several LAIs showed a greater benefit relative to LAI haloperidol for all outcome measures studied
- LAI paliperidone every 3 months, the LAI with the longest dosing interval, had the lowest risk of treatment failure, antipsychotic discontinuation, and psychiatric hospitalization
